The Embedded Real Time Database

User-Friendly Presentation of BUFR data

Ninth Workshop On
Meteorological Operational Systems
ECMWF, Reading, United Kingdom
November 11, 2003

Presentation of BUFR

- ★ Objective
- ★ Specifications
- ★ Tools
- ★ Methodology
- ★ Live Demonstrations
- ★ Questions and Answers

Background

- ★ BUFR as a standard data exchange

- ★ Ultimate goal of WMO
- ★ Omnipotent
- ★ Compressed data
- ★ Unreadable by humans

- ★ BUFR Decoders

- ★ Divergent
- ★ Require practical knowledge

Objective

Ability to “read” data inside BUFR records over the Internet using a user-friendly browser based interface.

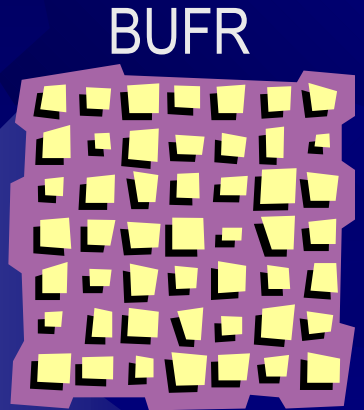

Specifications

- ★ Data to be stored in BUFR
 - ★ BUFR is not relational
- ★ Data to be decoded
- ★ Data to be extracted according to user defined criteria specified interactively
- ★ Data to be presented in a readable form
- ★ Data to be presented a wide range of user interface environments

Tools

INTERNET
INTRANET

USER

Tools

☀ Database system

- ☀ High level application programming interfaces (API)
 - ☀ JDBC, HTML, XML, ODBC, PHP, Perl
- ☀ High level API's are augmented with the BUFR decoder functionality
- ☀ BUFR decoder becomes meta data in database

☀ Internet Server

- ☀ Apache HTTP, Tomcat, MS IIS

Methodology

Methodology

EMPRESS DB ENGINE

Methodology

- ✦ Ingest BUFR Data into database
- ✦ Augment database system with decoding functions

Methodology

EMPRESS DB ENGINE

DATABASE

BUFR

DECODER

Ingesting BUFR into database

- ★ BUFR does not naturally translate into rows and columns
- ★ Ingest is a batch process
- ★ Range of ingest methods:
 - **Minimum** – store each BUFR record as BLOB
 - **Recommended** – store each BUFR record as BLOB alongside decoded product definition section (originating centre, date and time)
 - **Complete** – decode all of BUFR records and store it in a relational format

BUFR Decoder as meta data

- ★ Persistent Stored Modules
 - ★ a.k.a. User-defined functions
- ★ Decode all or parts of BUFR records as SELECT query
- ★ Extend decoding functionality to all API's (SQL, ODBC, JDBC, PHP, HTML, Perl, etc.)
- ★ Range of functions, each tailored for specific requirements
- ★ Database tables are perfect for BUFR reference tables
- ★ UDF decoders, BUFR reference tables and BUFR data make up a single entity

Live Demonstration

- ★ 45 650 BUFR messages
- ★ 3 145 145 subsets (observations)
- ★ Each subset contains 156 elements
- ★ Preprocessing batch:
 - ★ All BUFR messages stored in 45 650 records as BLOB data type
- ★ A few user-defined functions (PSM's) containing decoding functionality stored in the same database

Live Demonstration

Benefits

- ★ “Readable” BUFR data
- ★ Search through BUFR data
- ★ Download decoded BUFR data
- ★ Improved handling of BUFR messages
- ★ Improved management of BUFR reference tables
- ★ BUFR messages and its decoders united as a single logical entity - database
- ★ Seamless BUFR exchange independent of user data presentation environment

The Main Benefit

Facilitates the WMO objective to
standardize on table driven codes
BUFR and CREX
