- Summary

AIRS Cloudy Channel Determination - Approach

1. Estimate Channel Noise (NEdR)
 1. Dependent Principal Component Derivation from all, “clear and cloudy”, pixels
 2. Estimate measurement noise, NEdR, as the absolute value of difference of R_{obs} and R_{rec} , where R_{rec} is reconstructed from 20 largest DPCs (from step 1.1)
2. Derived Clear DPC
 1. Selected AIRS clear pixels only (defined by the co-located MODIS cloud mask where 99% of MODIS pixels within AIRS pixel are confident clear)
 2. Use spectra of clear AIRS pixels only to derive Clear DPC
3. Cloudy Channel Determination
 1. Confident Cloudy Channel Decision
Determine cloud channel as the absolute value of difference of R_{obs} and R_{rec} , where R_{rec} is reconstructed from 20 largest Clear DPCs (from step 2.1), that is larger than 1.5 times of NEdR (from step 1.2)
 2. Suspected Cloudy Channel Decision
Same as Confident Cloudy Channel except the absolute value of difference of R_{obs} and R_{rec} is smaller than 1.5 times of NEdR but larger than NEdR

AIRS Cloudy Channel Determination - Criteria

Number of cloudy channels G017 (clear pixels)

Clear - 3289

Overcast - 2758

Number of cloudy channels G017 (overcast pixels)

Number of cloudy channels G017 (partly cloudy pixels)

Partly Cloudy - 6103

Number of cloudy channels G017

Current* AIRS Cloudy Cloud Clearing Characteristic – **Characterization Approach**

1. Find at least one neighboring AIRS single FOVs (S-FOV) within or surrounding the AIRS golf ball that is clear (according to MODIS cloud mask for which that within this FOV at least 99% is clear). In other words, from 25 candidates (fig. 1 below) find one clear AIRS FOV as the “ clear ground truth” to estimate cloud clearing (CC) error.
2. Compute bias (mean of differences), RMSE, and RMSD spectra from all AIRS/AMSU golf ball CC that has found the corresponding clear S-FOV (defined as above) radiances.

Fig. 1, AIRS golf ball and its neighboring Single FOVs

Cloud Shape & Size Effects on IR Measurements

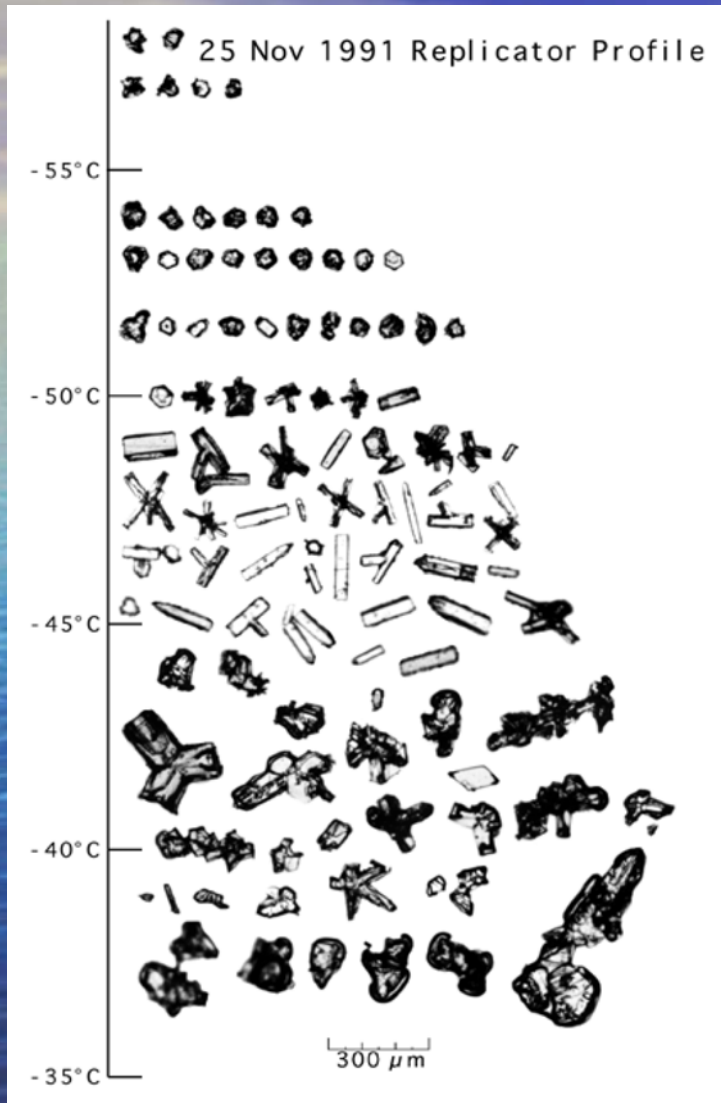

Comparisons of brightness temperatures of ice clouds for aggregate, hexagonal column, hexagonal plate, bullet-rosette, and sphere at 6 wavelengths by assuming the U.S. standard atmosphere. Clouds are located at 10 km altitude, and optical thickness is 1. These results are for a nadir view case.

Cloud Shape Effects on IR Measurements

Sphere

Replicator Particle Habits

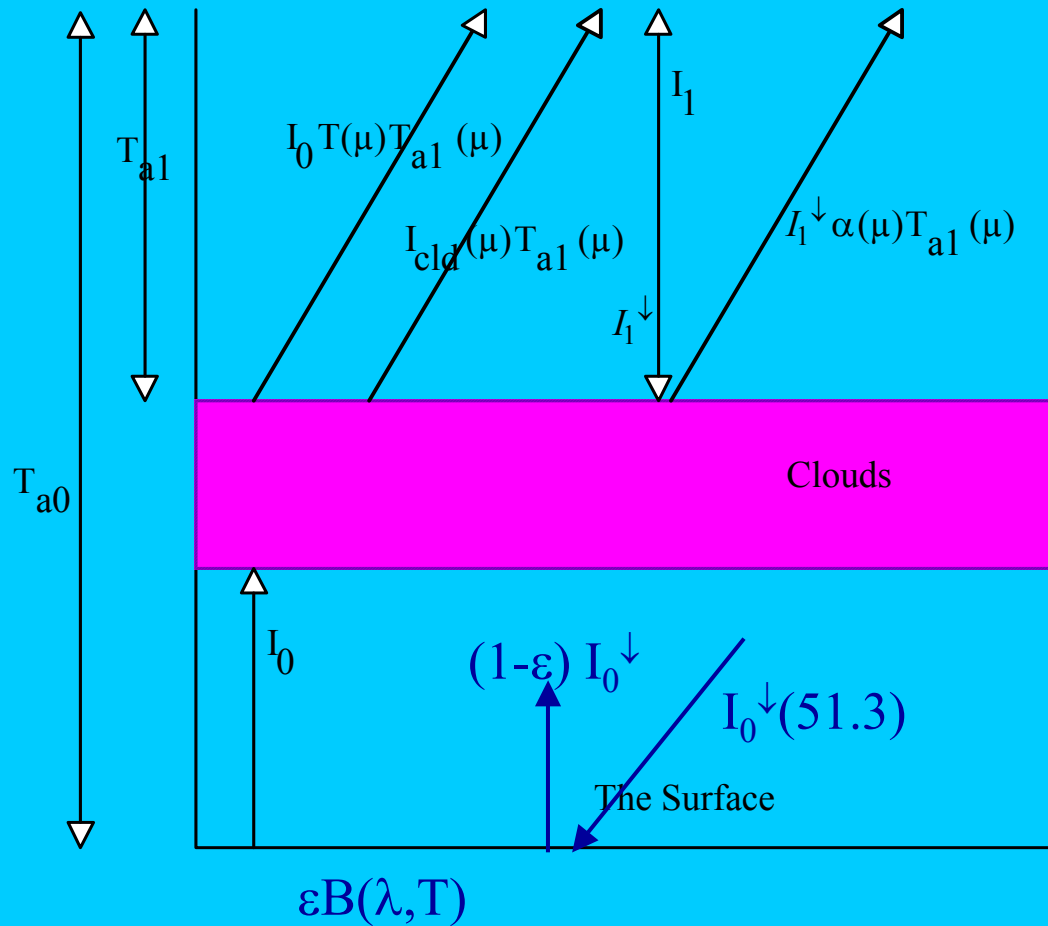

Simulated Particle Habits

From Ping Yang

Radiative Transfer Approx.

$$I_{top}(\mu) = I_0 T(\mu) T_{a1}(\mu) + I_{cl} T_{a1}(\mu) + I_1 + I_1^\downarrow \alpha(\mu) T_{a1}(\mu)$$

Radiative Transfer Approx.

$$I_{top}(\mu) = I_0 T(\mu) T_{a1}(\mu) + I_{cld} T_{a1}(\mu) + I_1 + I_1^\downarrow \alpha(\mu) T_{a1}(\mu)$$

Where:

$$I_0 = B(t_s) T_{a0} + \int_{T_{a0}}^{T_{a1}} B(t) dT_a$$

$$I_1 = \int_{T_{a1}}^1 B(t) dT_a$$

$$I_{cld}(\mu) = [1 - R(\mu) - T(\mu)] * B(t_c)$$

$$I_1^\downarrow = \int_{T_{a1}}^1 B(t) \frac{T_{a1}}{T_a} dT_a$$

T_{a0} and T_{a1} are clear sky atmospheric transmission from the space to the surface and to cloud top, respectively.

Cloud Database - albedo & transmissivity function

For ice clouds:

- ✓ **Optical thickness: 0.04-50**
- ✓ **Effective size: 10-157 μm**
- ✓ **Effective Shape:** Aggregates, solid hexagonal columns, Spheres, Bullet-rosettes, Droxtals, Hollow columns, Plates, and Spheroids (8)
- ✓ **Zenith angle: (0-80 $^\circ$)**
- ✓ **Wavenumber:(500-2500 cm^{-1})**

For water clouds:

- ✓ **Optical thickness: 0.06-150**
- ✓ **Effective size: 2-20 μm**
- ✓ **Zenith angle: (0-80 $^\circ$)**
- ✓ **Wavenumber:(500-2500 cm^{-1})**

Apperception* of Clouds in AIRS Data

Presentation Outline

- Clouds in AIRS Data – Almost Everywhere in Anytime
- AIRS Cloud Signature
 - Spatial, Noise, Spectral and Optical feature
- Cloud Clearing Issue
 - Current Operational C.C. Characteristic
 - Clear Vs. Cloudy Sounding
- Hyperspectral IR Cloud Forward Modeling
- **Summary**

Apperception* of Clouds in AIRS Data

Summary

- Knowing that clouds are dominating the IR measurements, **can spectral dependent clear/cloudy index (0 or 1, or 0 to 1) can be useful and reliable enough for NWP, cloud clearing, sounding retrieval and cloud property applications?**

Apperception* of Clouds in AIRS Data

Summary - continue

- **Cloud cleared radiances/soundings represent clouds nearby clear sky condition only and should be assimilated with caution:**
 - **Could introducing potential clear sky bias, however,**
 - **Cloud cleared radiances could be a useful intermediate product for cloud study**

Apperception* of Clouds in AIRS Data

Summary - continue

- **Microphysical property** of clouds should be characterized to allow any future accurate modeling and assimilation of cloudy radiances

Apperception* of Clouds in AIRS Data

Summary - Continue

- **Fast cloudy forward modeling development (limited effort so far) is underway, however, many challenges remain, and much more efforts are required**

Apperception* of Clouds in AIRS Data

Summary - Continue

- Preliminary synergistic imager/sounder (MODIS/AIRS) cloud clearing analysis showing it can provide
 - Consistent quality control, and
 - Stable cloud cleared radiances for both over ocean and land% (need further verification)

%So far AIRS has not demonstrated successful cloud clearing over land

Apperception* of Clouds in AIRS Data

Summary - Continue

- *Apperception of clouds in AIRS data could provide useful information for the optimization of planned MTG and GOES-R Imaging and Sounding instruments*
