

Probabilistic verification at high spatial resolution of the COSMO-LEPS limited-area ensemble system

Chiara Marsigli, Andrea Montani, Tiziana Paccagnella

ARPA-SIM, Bologna, Italy

The COSMO-LEPS suite since Feb. 2006

16 Representative Members driving the 16 COSMO integrations

employing either Tiedtke or Kain-Fritsch convection scheme (randomly chosen)

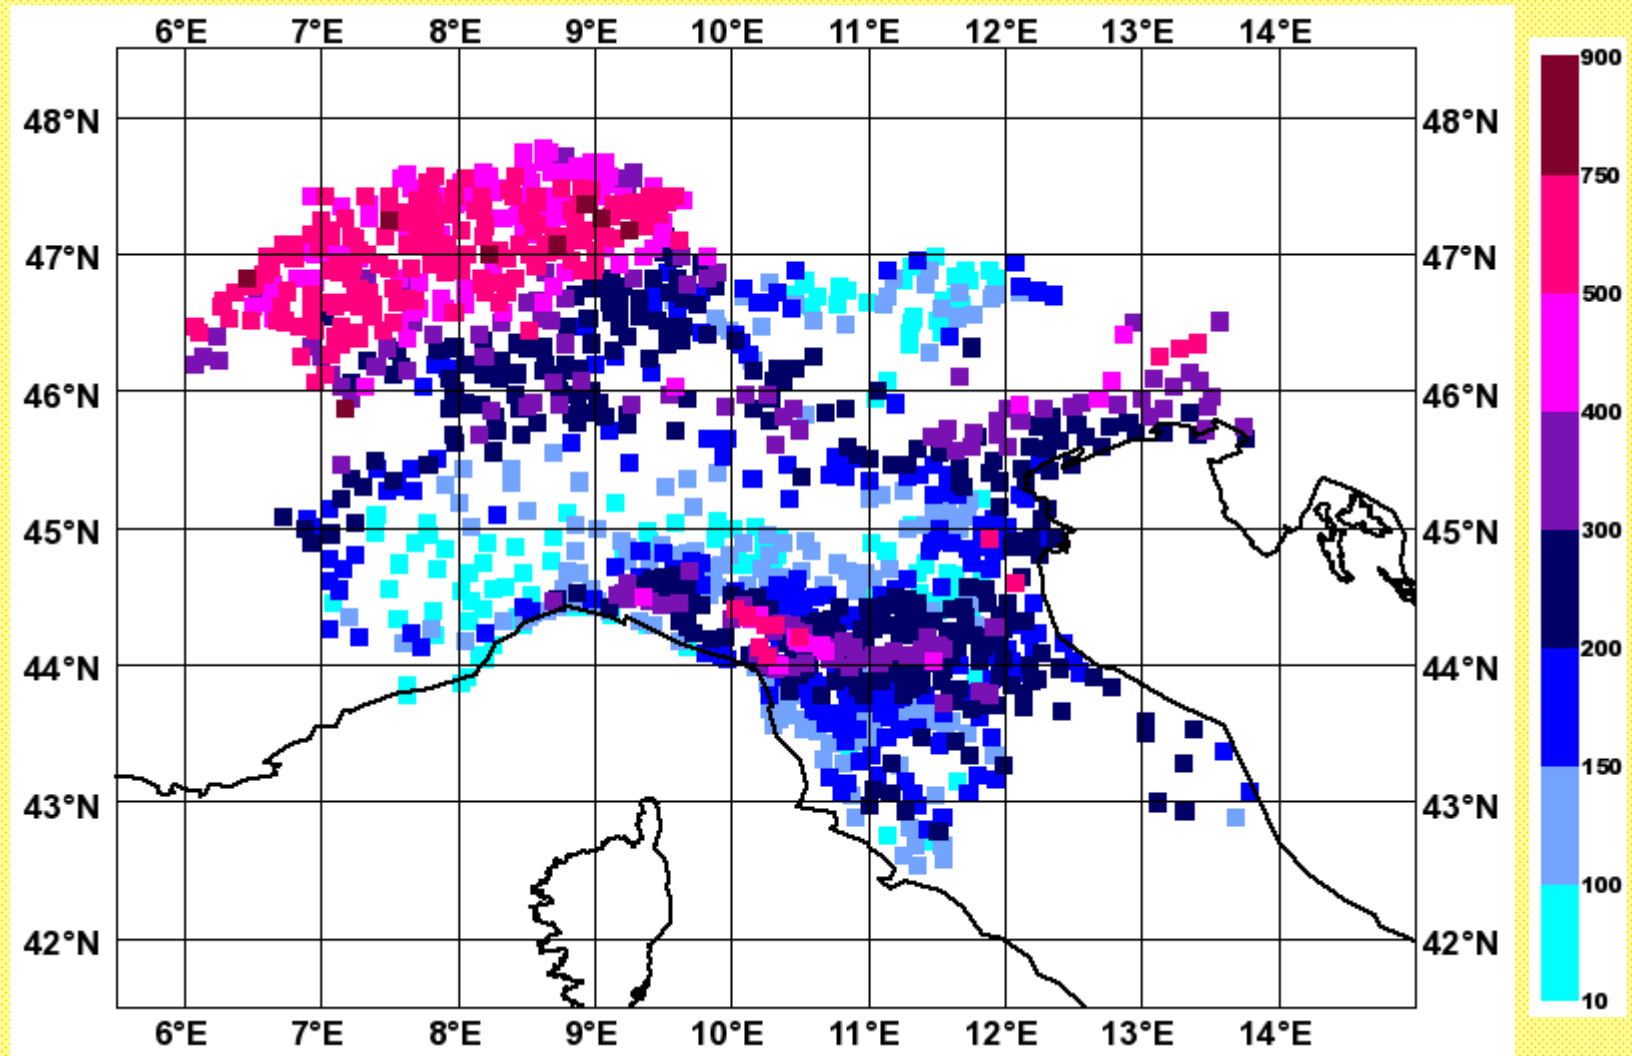

COSMO-LEPS clustering area

COSMO-LEPS integration domain

- 10 km
- 40 layers
- 16 members
- 132 h

observed accumulated precipitation MAM 2006

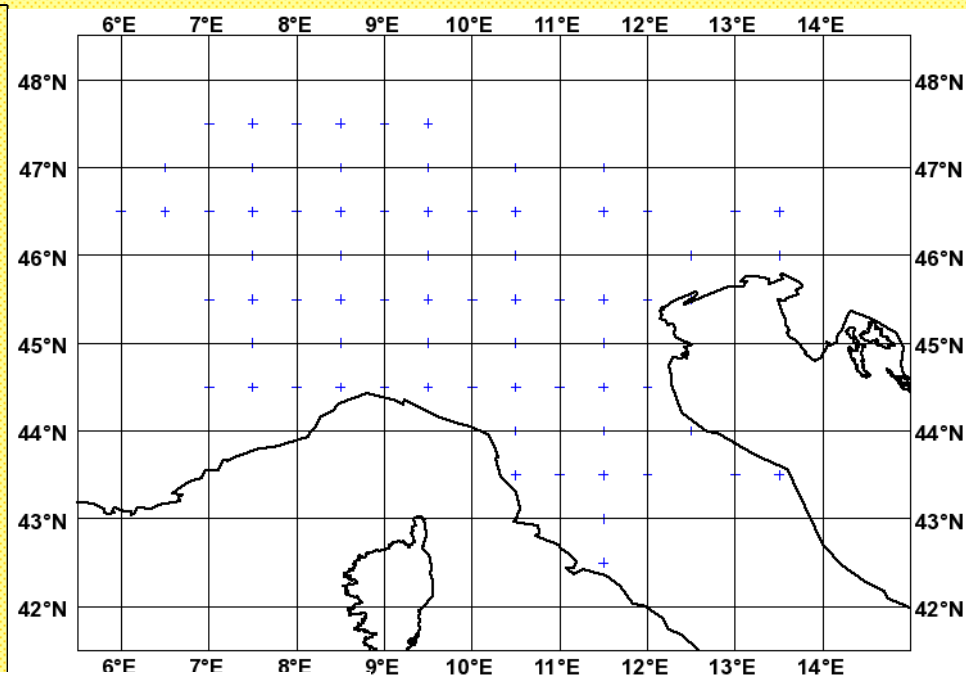

Verification issues

- ❖ verification of an **ensemble system**
- ❖ **high-resolution** model
- ❖ verification of **precipitation**
- ❖ **sparse observations** (high density)
- ❖ comparison of two systems with **different horizontal resolution** (10 and 50 km)
- ❖ give assistance to **forecasters**

observation masks

ECMWF EPS

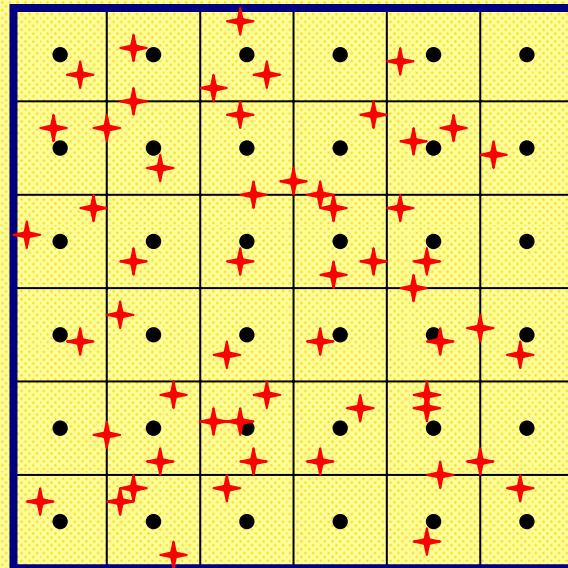

Verification of the distributions

The verification has been made in terms of:

- Average value
- Maximum value
- 50th percentile (Median)
- 90th percentile

} in a box

- + Station observation
- Grid point forecast

Each ensemble member is treated separately!

Conclusions

- ❖ a verification is applied trying to assess the quality of the distribution of the precipitation forecast by COSMO-LEPS
- ❖ prediction of average values: better ROC area for high precipitation thresholds
- ❖ COSMO-LEPS has skill in predicting precipitation maxima over a 1x1 degree box for any threshold
- ❖ higher ROC area value for the prediction of the 90th percentile
- ❖ importance of considering different scores
- ❖ importance of considering different parameters of the distribution
