About

Lagrangian parcel trajectories are widely used in the atmospheric and oceanic sciences, for instance, to identify flow structures in extratropical cyclones (e.g., warm conveyor belts) or ocean eddies, long-range transport pathways of moisture, or to study the physical processes underlying the formation of sea surface temperature, salinity or potential vorticity anomalies.

1. LAGRANTO.ECMWF

It is used to compute air-parcel trajectories typically based on 6-hourly ERA-Interim data on a regular lat/lon grid. In addition it was applied also to 20CR data.

Citation:

[Sprenger, M. and Wernli, H. \(2015\): The LAGRANTO Lagrangian analysis tool - version 2.0, *Geosci. Model Dev.*, 8, 2569–2586, doi:10.5194/gmd-8-2569-2015.](#)

2. LAGRANTO.COSMO

Is the version used to compute air-parcel trajectories based on the output of the COSMO mode. An online and offline version of the tools is available. For the online computation the actual model time step is used, which increase the accuracy of the trajectories.

Citation:

[Miltenberger, A.K., Pfahl S., and Wernli H. \(2013\): An online trajectory module \(version 1.0\) for the nonhydrostatic](#)

3. LAGRANTO.OCEAN

The ocean version is the latest member of the LAGRANTO family. It can be used to compute ocean-parcel trajectories based on ECMWF's Ocean Reanalysis data (ORAS5). The triangular grid of the input data is transformed and rotated into a regular lat/lon grid. At the boundaries no-normal and no-slip boundary conditions are applied. This version is under development.

Citation:

- Computation of Lagrangian parcel forward/backward trajectories
- Multiple options for selection of subsets (spatial & temporal criteria, physical properties)
- Freely available (versions for IFS, COSMO, WRF, UM)

Sprenger, M. and Wernli, H. (2015): The LAGRANTO Lagrangian analysis tool - version 2.0, *Geosci. Model Dev.*, 8, 2569–2586, [doi:10.5194/gmd-8-2569-2015](https://doi.org/10.5194/gmd-8-2569-2015).

1. Feature-based diagnostics: WCBs

Madonna, E., et al., 2014: Warm Conveyor Belts in the ERA-Interim Dataset (1979–2010). Part I: Climatology and Potential Vorticity Evolution. *J. Climate*, **27**, 3–26, [doi:10.1175/JCLI-D-12-00720.1](https://doi.org/10.1175/JCLI-D-12-00720.1).

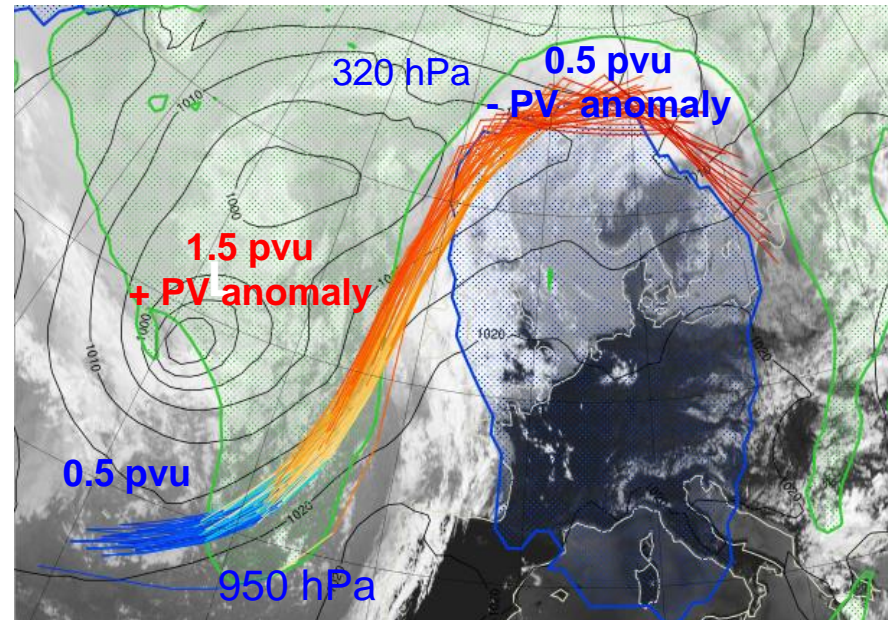

Warm conveyor belts

- rapidly ascending cross isentropic air flows (>600hPa/48h)
- diabatic heating of about 20K / 48h
- diabatic PV **production** below level of maximum heating
- diabatic PV **reduction** and low PV values at upper levels

see WCB clim. by Madonna et al. (2014)

Feature-based ERA-Interim Climatologies

This collection of ERA-Interim based global climatologies of Eulerian and Lagrangian flow features is based on past and ongoing research of the Atmospheric Dynamics group at ETH Zürich. This webpage offers you access to monthly or longer-term averaged global fields from these climatologies. You can download netCDF, png or pdf files for the desired time period. The available fields span the period from January 1979 until (currently) February 2014.

ECMWF analysis BT: 20160309_00Z
LAGRANTO start and PMSL VT: 20160309_00Z
IPV[2PVU] VT: 20160311_00Z

pmsl [hPa] and every 1 trajectory
WCB region: 70W30W20N50N_10

SOUTH

ECMWF analysis BT: 20160309_00Z
LAGRANTO start and PMSL VT: 20160309_00Z
IPV[2PVU] VT: 20160311_00Z

pmsl [hPa] and every 1 trajectory
WCB region: 50W8E20N60N_148

NORTH

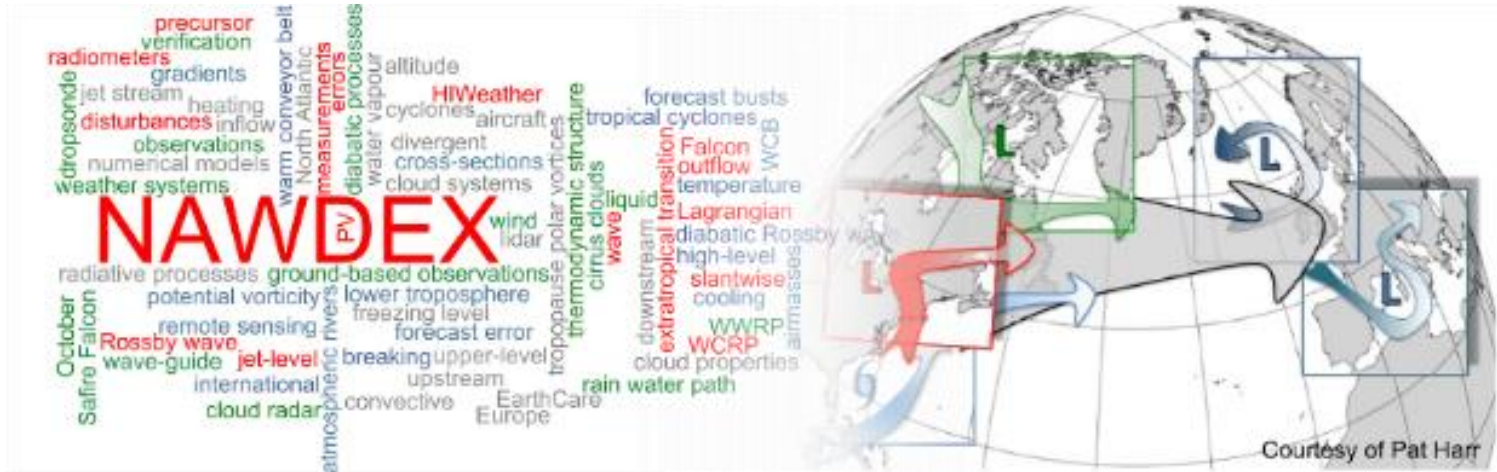

ECMWF analysis BT: 20160309_00Z
LAGRANTO start and PMSL VT: 20160309_00Z
IPV[2PVU] VT: 20160311_00Z

pmsl [hPa] and every 1 trajectory
WCB region: 70W10E60N80N_148

- Southern WCB branch is too strong, rather maintains AR
- Northern branch is too weak, BL does not establish over Scandinavia

5. Demonstration NAWDEX

Demonstration of flight planning for IOP2 21 Sep 2016

Successful Mission!

6. Summary and Outlook

- Comprehensive catalogue of feature-based ERA-I climatologies
<http://eraiclim.ethz.ch/>
 - LAGRANTO trajectory model
<http://lagranto.ethz.ch/>
- facilitate research of atmospheric dynamics from a weather system perspective

- Specific forecast products enable flight planning for atmospheric measurement campaigns

<http://nawdex.ethz.ch/>

ERA-5 !?

A. Diabatic influences on blocking

Pfahl, S., C. Schwierz, M. Croci-Maspoli, C. M. Grams, and H. Wernli, 2015: Importance of latent heat release in ascending air streams for atmospheric blocking. *Nature Geosci*, **8**, 610–614, [doi:10.1038/ngeo2487](https://doi.org/10.1038/ngeo2487).

Diabatic heating and PV anomalies

Pfahl, S., et al. (2015), *NatGeo*, [doi:10.1038/ngeo2487](https://doi.org/10.1038/ngeo2487).

Diabatic heating during blocking life cycle

Pfahl, S., et al. (2015), *NatGeo*, [doi:10.1038/ngeo2487](https://doi.org/10.1038/ngeo2487).

slides by Stephan Pfahl

Spatial distributions of trajectories

Pfahl, S., et al. (2015), *NatGeo*, [doi:10.1038/ngeo2487](https://doi.org/10.1038/ngeo2487).

Adiabatic trajectories (cat. B)

Diabatic trajectories (cat. C)

Normalized trajectory density 3 days before arrival in the blocking region for **winter**. Purple contour indicates main trajectory starting regions.

slides by Stephan Pfahl

A. Potential Vorticity

Potential vorticity

$$PV = \frac{1}{\rho} \vec{\eta} \cdot \nabla \Theta$$

$$PV = \frac{1}{\rho} \eta \frac{\partial \Theta}{\partial z}$$

unit: 1PVU = 10^{-6} K m² kg⁻¹ s⁻¹

$\eta = f + \vec{k} \cdot \nabla \times \vec{v}_h$ Absolute vorticity / horizontal flow

Vertical stratification of the atmosphere/stability

$$\frac{dPV}{dt} = \frac{1}{\rho} \vec{\eta} \cdot \nabla \dot{\Theta} + \frac{1}{\rho} (\nabla \times \vec{F}) \cdot \nabla \Theta$$

Total change in PV

adiabatic PV modification

frictional processes

- PV is conserved under adiabatic frictionless flow (**conservation principle**)
 - use PV as air mass tracer on isentropic surfaces to identify PV signatures of weather systems
- PV can be inverted given a balance condition and boundary conditions (**inversion principle**)
 - derive wind, T, p field from a given PV distribution

Potential vorticity

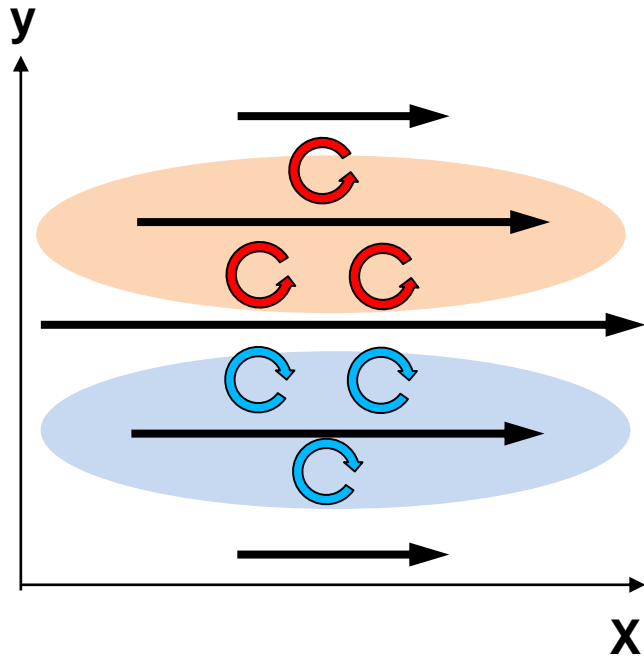

$$PV = \frac{1}{\rho} \vec{\eta} \cdot \nabla \Theta$$

$$PV = \frac{1}{\rho} \eta \frac{\partial \Theta}{\partial z}$$

unit: 1PVU = $10^{-6} \text{ K m}^2 \text{ kg}^{-1} \text{ s}^{-1}$

$\eta = f + \vec{k} \cdot \nabla \times \vec{v}_h$ Absolute vorticity / horizontal flow

Vertical stratification of the atmosphere/stability

North of jet streak

Pos. shear vorticity, **high PV**

South of jet streak

neg. shear vorticity, **low PV**

Stratosphere:
High stability, **high PV**

Troposphere:
Lower stability, **low PV**

PVU
